# Little Learners user guide

A guide for parents teachers and children

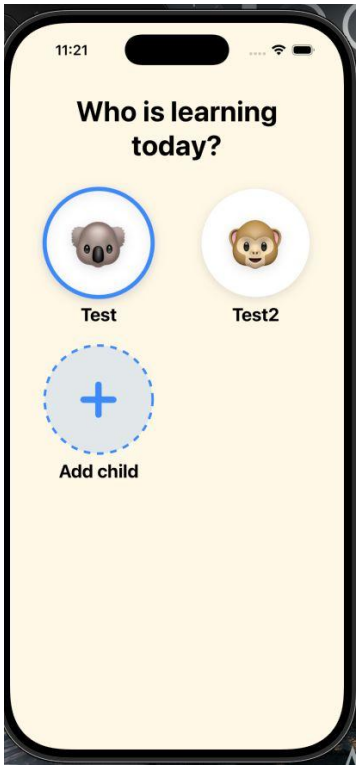

K. Thiveesan

IT23204348

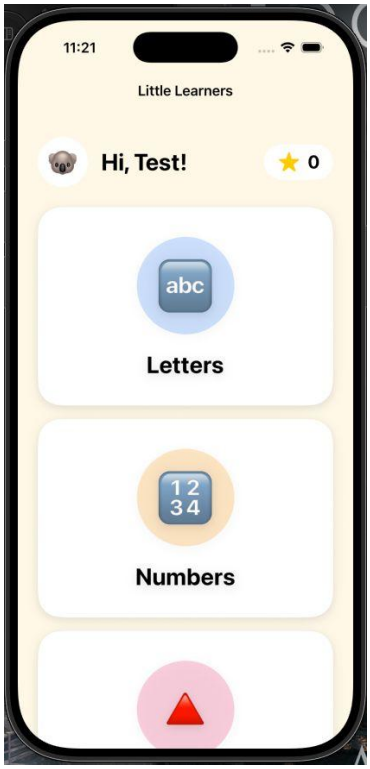

## Getting started

Little Learners provides letters, numbers, tracing and shape matching. An adult should help a child set up a profile and explain the first activity. Use a device on which the project has already been installed. Developer installation steps are in the technical documentation.

- On first use, enter the child's name, choose an avatar and choose a language. Tap Let's go!
- When profiles already exist, select the child on Who is learning today? Use Add child to create another profile.
- Check the greeting on Home to confirm the selected child. Tap the avatar on Home to switch children.
- Choose Letters, Numbers or Shapes. Scroll down if the lower buttons are outside the visible screen.

Profile selection and Add child.

Home shows the active child and activity choices.

Progress belongs to the selected child. The interface language and sound settings apply across the app.

# Letters and numbers

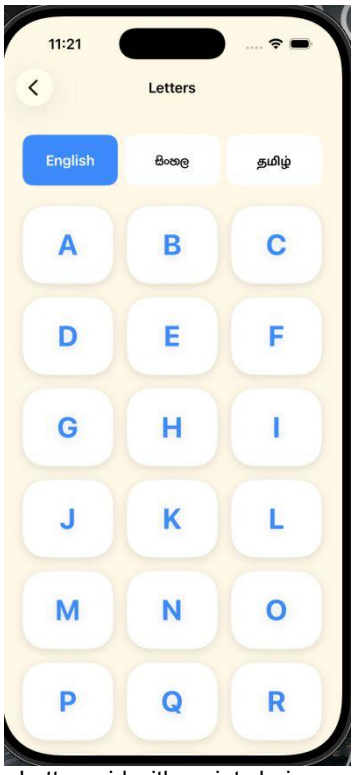

• Select Letters on Home. Choose English, Sinhala or Tamil using the script selector.

• Select a character from the grid to open its lesson.

• Read the large character and example word. Tap the speaker button when available to hear the item.

• Use the previous and next controls or swipe to move between lesson items.

• Tap Trace it to practise the displayed item. For number practice, return to Home and select Numbers.

Letter grid with script choices.

Lesson with example word, navigation, audio and Trace it.

The speaker button may be unavailable when sound is disabled or the device does not have a suitable voice. The visible character and example remain available.

## Tracing a character

• Open a lesson and tap Trace it.

• Draw over the dotted guide with a finger. In the simulator, use the pointer to draw.

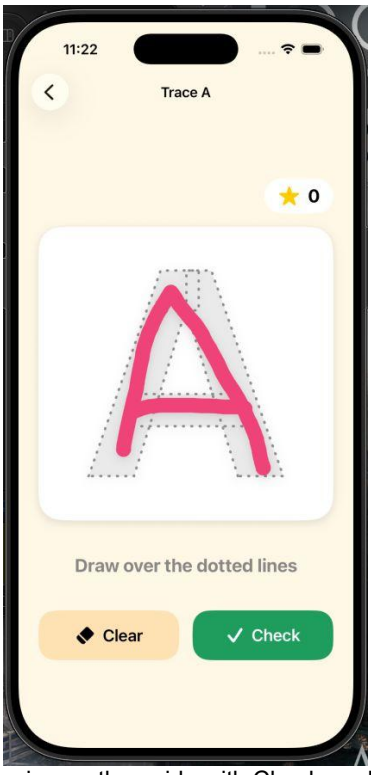

• Tap Check to evaluate the drawing. Check is disabled until a drawing exists.

• Use Clear to remove the strokes and try again.

• A successful check awards a star and updates the selected child's progress. Use the back control to return to the lesson.

An empty tracing guide before drawing.

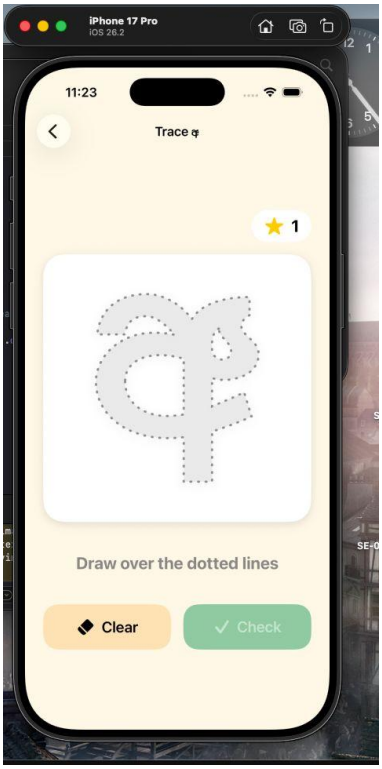

A drawing on the guide with Check enabled.

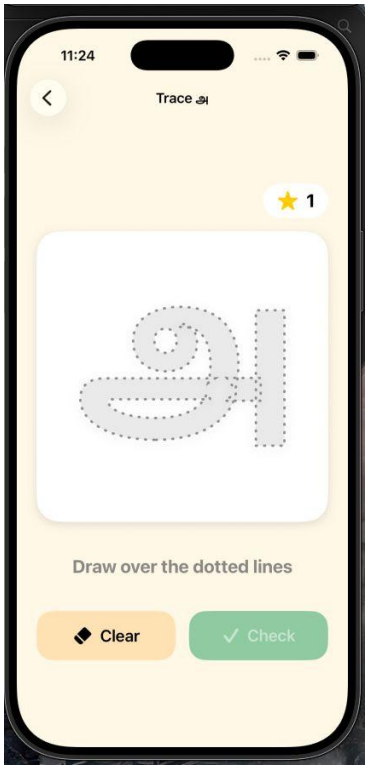

Feedback encourages practice. It is not a formal assessment of handwriting or development. A drawing that covers the guide can pass even when character recognition is uncertain.

# Sinhala and Tamil practice

Choose the required script in the Letters screen, open a character and tap Trace it. Follow the same Clear and Check workflow as for English. The app checks these drawings by how much of the guide the strokes cover and how much lies outside the guide.

Sinhala tracing example.

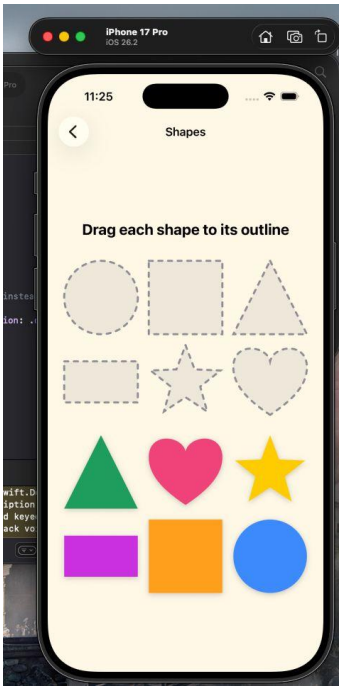

Tamil tracing example.

The interface language can also be changed through the parent area. Choosing a script in Letters selects learning content; changing the app language changes interface text. A parent or teacher should verify unfamiliar example words and pronunciation.

# Shapes rewards and parent controls

In Shapes, drag each coloured shape onto its matching dotted outline. Work through all six shapes. Use the back control to return to Home. Open Rewards to view the sticker book and earned badges.

Shape matching uses drag gestures and matching outlines.

To inspect progress, tap Parents on Home and answer the maths question. The dashboard shows the active child's stars for the last seven days, progress by category and recent tracing. Use the Children section to manage profiles. Settings provide Language, Sound and Reset progress.

Reset progress deletes the selected child's stars, badges and tracing history while keeping the profile. Deleting a child removes the profile and linked learning records. Read the confirmation carefully. The maths question is a simple parental gate, not an account login.

## Common questions

| What happens | What to do |
| --- | --- |
| I cannot hear a lesson | Check Sound in the parent area and the device volume. A suitable system voice must be available. |
| Check is grey | Draw on the guide first. Checking is also unavailable while evaluation is running or after the current attempt has passed. |
| The wrong child is shown | Return Home, tap the avatar and select the correct profile. |
| A good tracing is rejected | Clear and try again with deliberate strokes over the guide. Recognition and coverage have limitations. |
| Text or buttons do not fit | Scroll the page. Report the screen, device, orientation and text-size setting to the developer. |
| Progress is missing after restart | Check the selected child. Record the steps and tell the developer; save failures may not currently show an alert. |

## Using the app comfortably

Take short sessions and let the child repeat activities at their own pace. Adults can use larger system text where helpful. VoiceOver labels support navigation, but the tracing activity needs drawing input and is not fully operable through VoiceOver alone.

## Data and installation

The implementation uses local device storage for profiles and learning records. There is no implemented account sync or recovery service. Keep the demonstration installation intact until the assessment is complete. The project is an assignment build; this guide does not claim App Store availability.
