NurseryConnect prototype report

SE4041 Assignment 02 Part B

K. Thiveesan

IT23204348

Concept and target users

NurseryConnect explores a spatial diary dashboard for nursery keyworkers. A keyworker can review a child's activity, mood and notes in a readable card and open the full observation when needed. The proposed setting is a staff review session in which adults discuss records and plan follow-up activities.

The target users are nursery practitioners and managers. The potential buyer is a nursery operator or education organisation. The prototype uses the Little Stars Nursery name and sample diary entries. It does not establish a relationship with a real nursery, paying customers or a measured market opportunity.

Value proposition

The proposed value is a focused observation-review workspace that can use visionOS windows and attached controls. A future version could support arranging selected records side by side during staff review. That comparison experience is a product hypothesis and is not implemented as independently placed cards in the current source.

The current prototype demonstrates a welcome window, a separate diary window, a keyworker ornament, card selection and a detail sheet. The local Add Entry update introduces a create-and-review workflow and removes the six-card display limit. It still requires a fresh Xcode build and a test showing that records refresh and persist.

Why visionOS

visionOS offers window placement and input conventions that could support a spacious review surface. NurseryConnect uses SwiftUI windows and an ornament, which are platform-specific mechanisms. The justification should be tested against a conventional tablet workflow: a headset must improve a concrete review task enough to justify its cost, comfort and training demands.

The prototype is intended for adult staff use. No evidence is presented that wearing a headset while supervising children is appropriate. The proposed pilot would focus on a dedicated review setting.

Comparable applications

Product	Relevant established features	Lesson for NurseryConnect
Famly	Online learning journals and observations; family contributions and sharing	Diary capture and communication are established needs. A spatial product must prove an additional benefit.
Tapestry	Online learning journals, observations and development monitoring with family involvement	A new prototype should offer clear review value rather than claim that digital observations are a new concept.
NurseryConnect	Local prototype with diary cards, detail view, ornament and a local Add Entry patch	Focus evaluation on staff review in visionOS; broader nursery administration remains outside scope.

Famly and Tapestry are comparable by workflow rather than evidence of identical visionOS products. This comparison does not claim that either lacks spatial features. Their official product pages demonstrate that learning journals and observation records are an existing product category.

Proposed differentiation

NurseryConnect's differentiation would be the quality of a focused spatial review session: quick access to relevant observations, readable records and simple comparison. The current app is an early technical foundation. It does not yet demonstrate a validated advantage over phone, tablet or web-based systems.

Market validation plan

Start with interviews with nursery staff and managers about how they review observations, where information gets lost and whether spatial comparison would help. Use anonymised or fictional records in an initial demonstration. Compare a fixed set of review tasks in the prototype and a conventional screen layout.

- Measure task completion, mistakes and the time taken to find a relevant observation.
- Ask about comfort, willingness to use the interface and whether a headset adds useful value.
- Confirm who would purchase the product and whether an add-on or standalone service is preferred.
- Use feedback to decide whether to continue the visionOS direction or keep the workflow on a more accessible platform.

Interaction design and implementation

The welcome screen introduces the app and exposes Open Diary Cards View. The keyworker ornament shows the entry count and date without occupying the main content area. Diary cards show a concise summary, and selecting a card opens the complete notes and timestamp. Shared green and neutral colours provide continuity across the views.

DiaryEntry is a SwiftData model with an identifier, child name, activity, notes, mood and timestamp. NurseryConnectVisionApp shares a ModelContainer between the welcome and diary window groups. The initial implementation inserts six sample records. The local update uses the same model and storage configuration for newly entered observations.

The Add Entry form requires a non-empty child name, activity and notes after trimming whitespace. It offers the existing mood values, an explicit save operation and a cancellation path. A failed save keeps the input visible. The diary uses a newest-first query and scrollable grid so records after the sixth remain reachable.

Evaluation against Part B

Criterion	Evidence	Remaining limitation

Innovative concept	Nursery observation review framed for visionOS	Spatial benefit remains a hypothesis
Functional prototype	Welcome, cards, details and ornament in base source; Add Entry in local patch	Patch build and persistence test outstanding
Platform interaction	Window groups, ornament and hover behaviour	No independent 3D cards or immersive scene
Technical proficiency	SwiftUI, shared SwiftData container and modular views	Recovery, seeding ownership and tests need improvement
Pitch	Value, market, revenue proposal and launch plan included	Customer interviews and commercial validation not completed

Business model and launch proposal

A proposed revenue model is a nursery subscription with optional onboarding and staff training. Pricing has not been validated and no current sales are claimed. An alternative is a paid spatial review add-on integrated with an existing observation platform, subject to technical feasibility and partnership agreement.

A cautious go-to-market plan begins with a demonstrable workflow, followed by a small evaluation with willing nursery staff. After fixing observed usability and reliability problems, a pilot could test repeated use and willingness to pay. Wider promotion through nursery networks or education events should follow useful pilot evidence.

Stage	Deliverable	Decision evidence
Prototype completion	Reliable create, view and relaunch workflow	Build results and repeatable functional checks
Staff evaluation	Comparison with a conventional screen workflow	Task results and participant feedback
Pilot	Limited recurring use with agreed safeguards	Retention, useful review outcomes and support burden
Commercial decision	Defined offer and tested pricing	Buyer interest and sustainable delivery costs

Risks and next work

Hardware availability and cost may limit adoption. Long text entry and headset comfort may make a conventional device preferable for recording observations. Authentication, sharing and synchronisation remain future work. The product should earn a place in a nursery's routine through measured usefulness rather than relying on novelty.

The immediate technical priorities are a fresh build, verification of Add Entry, single-owner sample insertion, visible storage errors and correction of the SE4020 panel label. Independently arranged record windows and comparison controls are later design work. They should only appear in a future-feature section until implemented.
